

MERA provides results
in the context of water
contamination.

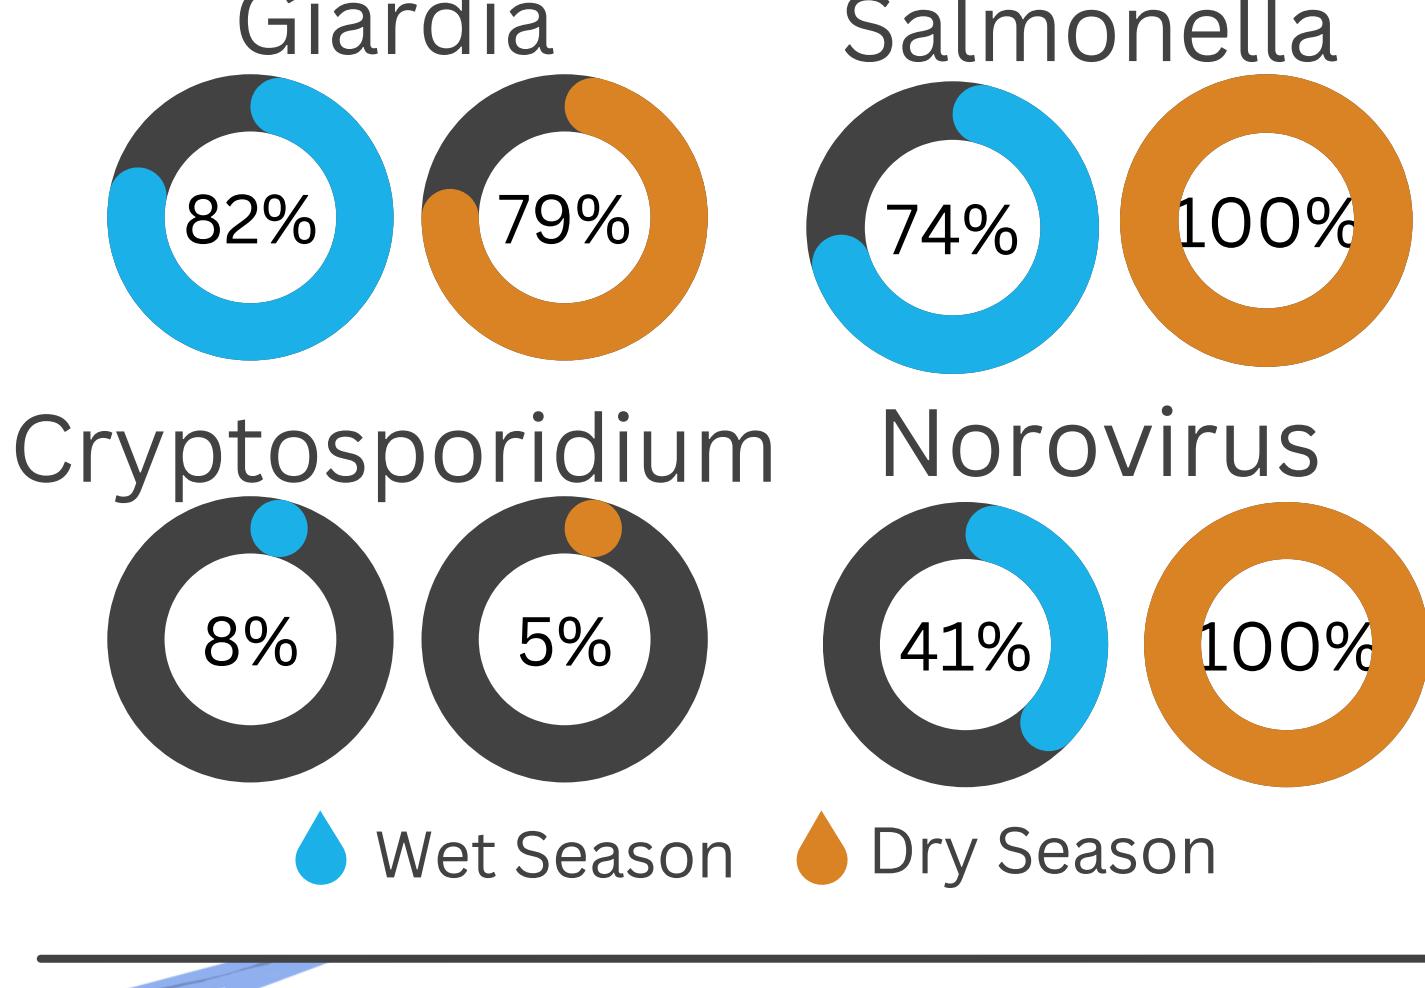

The results have the
potential to influence
water policies in
Costa Rica.

IN FOCUS

THE FINDINGS

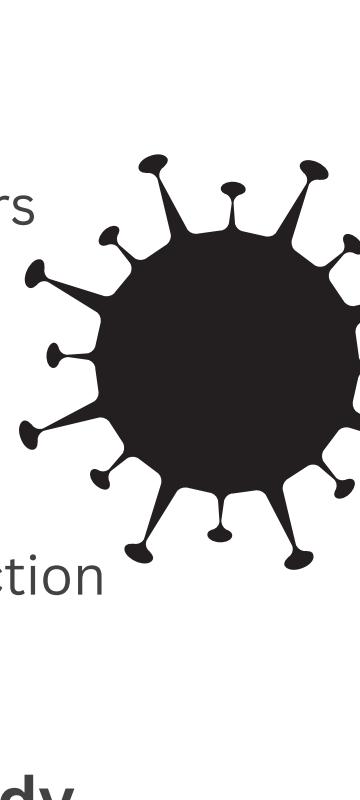

Water Quality

- The rivers are a constant source of contamination, regardless of season.
- The rivers most affected correspond to the most developed sub-watersheds.
- The most important predictive environmental variable is antecedent rainfall.

Quantitative Microbial Risk

- There is a risk to human health for swimmers regardless of the season.
- Human enteric viruses (NoVGI and AdV) contribute most to the risk of gastrointestinal disease.
- All sub-watersheds require pathogen reduction to ensure safe swimming conditions.

Epidemiological Study

- 5,000 Surveys
- 2,808 hours surveying beachgoers
- >1,000 follow up surveys

Ethnographic Study

- 500 observations of human behavior at the beach
- 80 Interviews
- Participant observation
